

Employee Lifecycle Management – Project Report

This document provides concise project documentation for the **Employee Lifecycle Management** application built on ServiceNow. The application automates employee onboarding and offboarding activities for HR and IT teams, reducing manual work and improving process consistency.

Purpose: Provide a structured reference for the application's scope, design, automation, and reporting capabilities.

Project Overview

Employee Lifecycle Management is a custom ServiceNow application designed to manage the full employee journey from joining to exit. It centralizes employee data, standardizes request handling, automates approvals and notifications, and improves visibility through reports.

Objectives

- Automate onboarding and offboarding workflows
- Reduce manual coordination between HR and IT
- Improve accuracy and consistency of employee records
- Track asset allocation and return activities
- Provide actionable reporting for operational monitoring

Features

- **Employee Management:** Maintain core employee records and status
- **Onboarding Request Management:** Create and track new joiner requests
- **Offboarding Request Management:** Create and track exit requests
- **HR Approval Automation:** Route approvals automatically for validation
- **Asset Allocation Tracking:** Monitor assigned and returned assets
- **Automated Email Notifications:** Send timely communication during lifecycle events
- **Business Rules:** Enforce data logic and process behavior
- **Record Producers:** Simplify request submission from the service portal
- **Reports and Analytics:** Deliver operational insights to stakeholders

Technologies Used

Employee Lifecycle Management – Project Report

Technology	Purpose
ServiceNow Studio	Application development and configuration
Flow Designer	Workflow automation for onboarding and offboarding
Business Rules	Backend logic execution and data updates
Record Producers	User-friendly form submission for requests
Notifications	Automated email communication
Reports	Operational dashboards and summaries
ACLs	Control access to records and modules
Custom Tables	Store application-specific lifecycle data

Custom Tables

The application uses custom tables to organize lifecycle-related records in a structured way.

Table	Description
Employee	Stores employee master information and employment status
Onboarding Request	Captures new employee joining requests and progress
Offboarding Request	Captures employee exit requests and completion steps
HR Approval	Tracks approval records for onboarding and offboarding
Asset Allocation	Maintains asset assignment and return details

Business Rules

Business Rules support data consistency and process control within the application.

- Automatically update request status based on workflow progression
- Create related approval or asset records when conditions are met
- Update employee status during onboarding or offboarding events
- Validate required fields and maintain record integrity

Note: Business Rules are used where immediate server-side actions are required to keep records synchronized.

Employee Lifecycle Management – Project Report

Flow Designer

Flow Designer automates the major lifecycle processes and reduces manual follow-up.

Onboarding Flow

1. Update request status
2. Create HR approval
3. Create asset task
4. Create asset allocation
5. Send welcome email

Offboarding Flow

1. Update request status
2. Create HR approval
3. Create asset return tasks
4. Update employee status
5. Send exit email

Record Producers

Record Producers are used to simplify request creation through a guided user interface. They help end users submit onboarding and offboarding requests without interacting directly with underlying tables.

- Onboarding request submission form
- Offboarding request submission form

Notifications

Notifications keep stakeholders informed during key steps of the lifecycle process.

- Welcome email for onboarding completion or progress
- Exit email for offboarding communication
- Approval-related notifications for HR actions
- Status-based alerts for request updates

Employee Lifecycle Management – Project Report Reports

The application includes reports that support monitoring, audit readiness, and decision-making.

- Employee Status Report
- Department Wise Employees
- Onboarding Requests
- Offboarding Requests
- HR Approval Status
- Asset Allocation Status

Testing

Testing was performed to confirm that the application functions correctly across major lifecycle scenarios.

- **Functional Testing:** Verified request creation, approval generation, status changes, and notifications
- **Workflow Testing:** Confirmed onboarding and offboarding flows execute in the expected order
- **Data Validation Testing:** Ensured records are created and updated correctly across related tables
- **Report Testing:** Verified that reports display relevant and accurate information
- **Access Testing:** Reviewed ACL behavior for authorized access to records and modules

Result: The solution supports reliable automation of employee lifecycle operations with improved visibility and reduced administrative effort.

Conclusion

The Employee Lifecycle Management application demonstrates how ServiceNow can be used to automate HR and IT coordination across onboarding and offboarding. By combining custom tables, workflows, business rules, notifications, and reports, the application improves efficiency, reduces manual dependency, and provides better control over employee lifecycle operations.
